THIS IS HOW WE CREATE A

# Circular economy

IN FINLAND

## Use

The product should be used for as long as possible, it must be serviced and repaired and parts changed when necessary. At the end of its life cycle, the parts or material can be reused in the life cycle of some other product.

## Consumer

Demand creates a supply of sustainable products and commodities. Every consumption decision either takes us towards or away from a circular economy.

## From company to company

Companies will procure and require their subcontractors to provide parts and components that can be easily repaired – instead of fixed and single-use parts. They will also provide maintenance services for the products they sell.

## Retail

Retailers will sell more services instead of goods and inform customers about maintenance and repair services, environmental impacts, materials and further use in the final phase of the life cycle.

## Distribution

Transport co-ordinated between different sectors, renewable fuels and jointly owned transport equipment will provide a more sustainable basis for the transfer of products and materials.

## Manufacturing industry

Industry will receive accurate information about the materials it uses, so that they can be identified and separated at the end of the product's life cycle. Long-term products that can be repaired and maintained will be brought onto the market.

Initially, Finland's circular economy will grow from the following five areas.

- 1 Sustainable food system**  
Consumers choose food that has been produced through the wiser use of raw materials that starts in primary agricultural production. Emissions and resource consumption will be lower.
- 2 Forest-based loops**  
Finland is a circular bioeconomy leader because of its forestry and forest industry. Global competitiveness will increase with new commercial products, services, co-operation models and digital technology.
- 3 Technical loops**  
Minimising the use of virgin raw materials creates a competitive edge. At the same time, we will maximise the length of material and product life cycles and opportunities for reuse.
- 4 Transport and logistics**  
Transport will develop into a seamless, smart system that uses fossil-free fuels. Mobility as a Service (MaaS), the sharing economy and optimised and clean transport will take mobility to a new level.
- 5 Common action**  
Legislators, companies, universities and research institutes, consumers and citizens, and vibrant regions are all needed to achieve systemic change. Communication and diverse interaction are particularly important when implementing joint action.

## Primary sector

The raw materials are capital for the primary sector. Sustainable solutions are dependent on the protection of raw materials. The aim of a circular economy is to keep Finland vibrant for people and nature.

## Material processing

Process planning will decrease the energy need for processing huge amounts of raw materials and the amount of surplus material. The use of side streams will be taken into consideration in, for example, environmental impact assessments and environmental permit processes.

## The life cycle continues in a new loop

At the end of its life cycle, the product and material returns to the loop – in the same life cycle or that of another product. It is impossible or very uncommon for it to become waste.

(Sitra 2016)

# From Linear to Circular Economy: What changes?

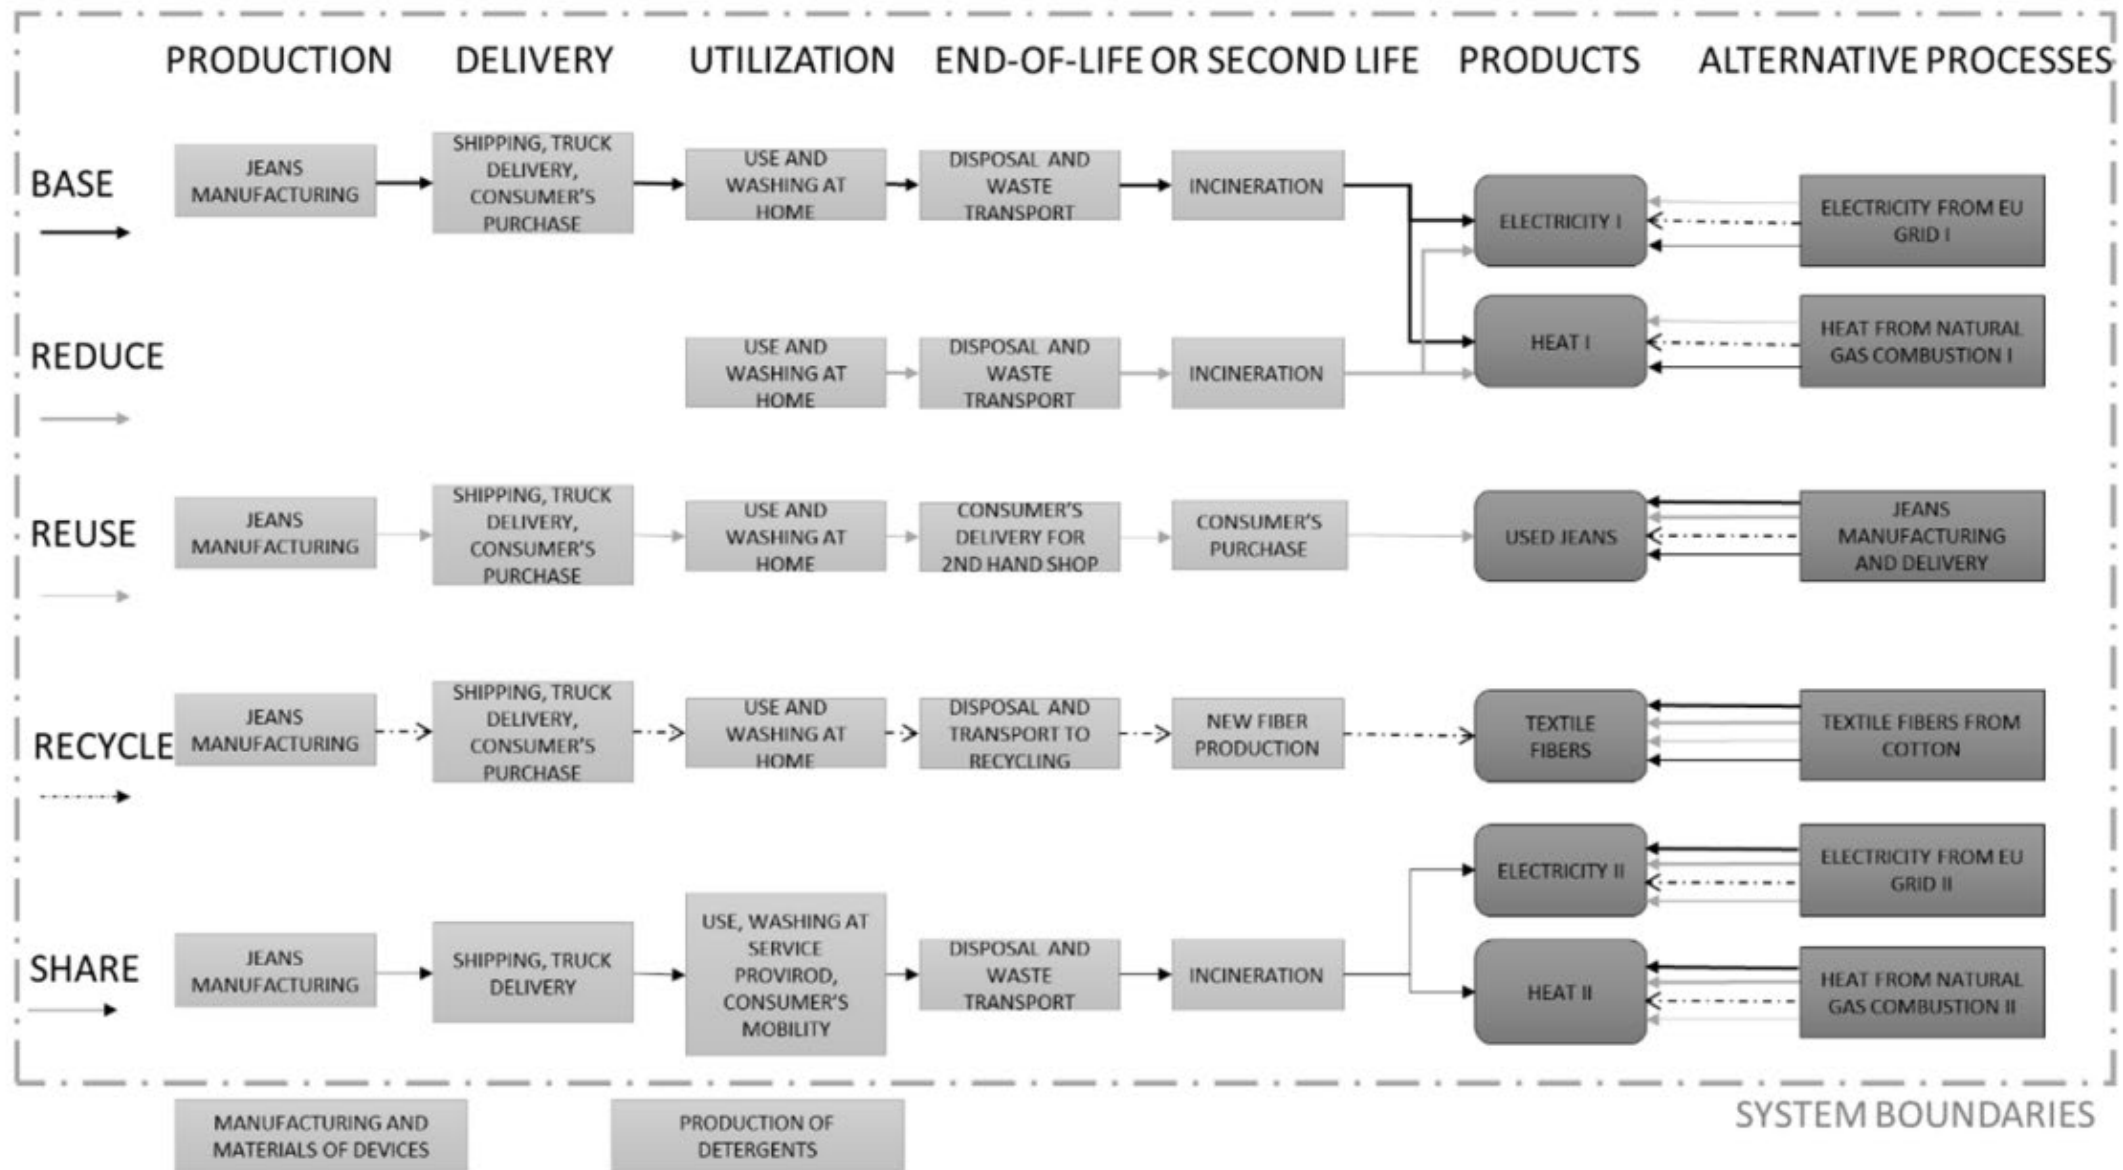

## From a linear economy to a circular economy

### LINEAR ECONOMY

### CIRCULAR ECONOMY

**Figure 1.** System expansion comparison of BASE, REDUCE, REUSE, RECYCLE and SHARE scenarios as well as system boundaries for different ownership and end-of-life scenarios for jeans.

(Levänen et al. 2021)

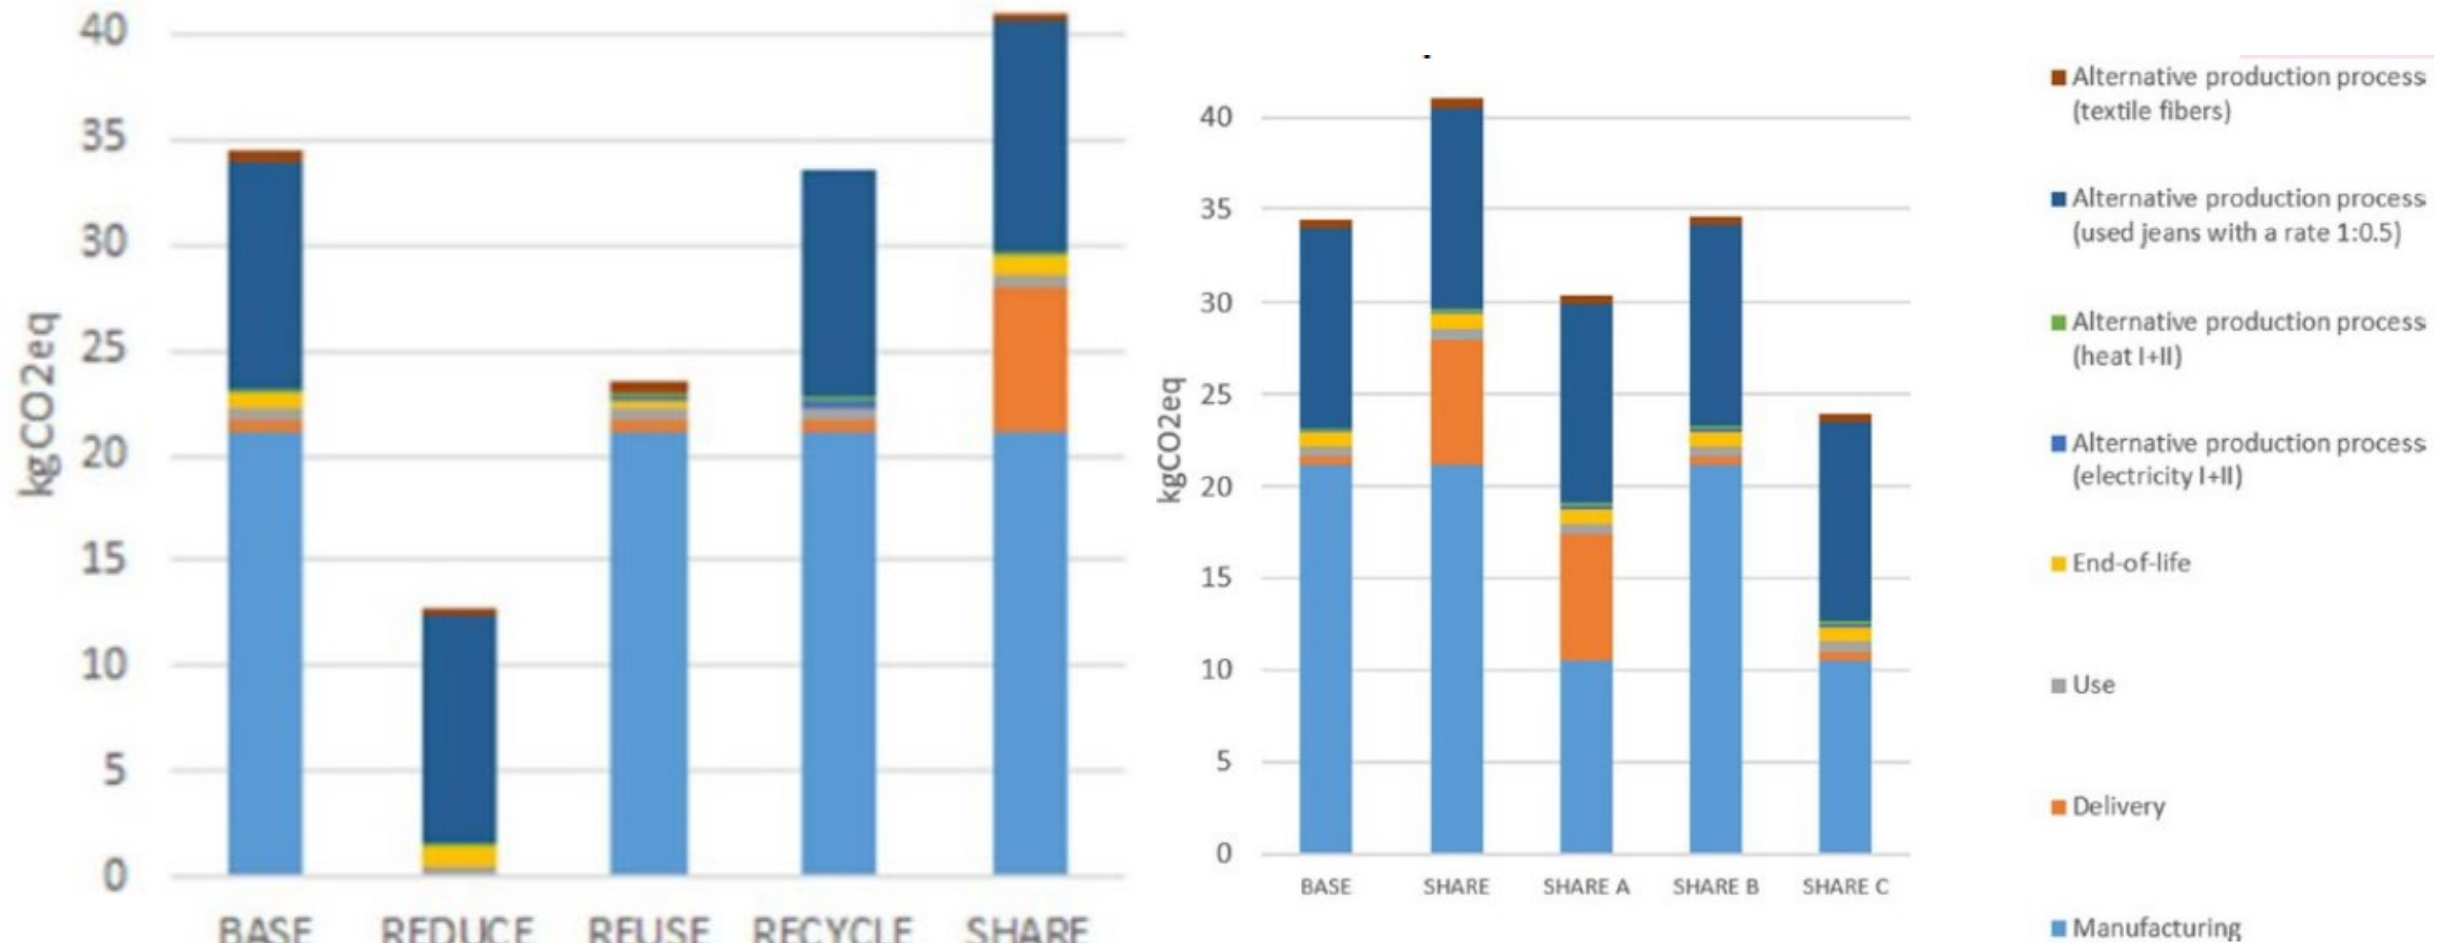

Figure 3. Sensitivity analysis for the SHARE scenario.

# **Environmental impacts:** More than just global warming

### ▼ Impact categories

Name	Reference unit
agricultural land occupation - ALOP	m <sup>2</sup> a
climate change - GWP100	kg CO <sub>2</sub> -Eq
fossil depletion - FDP	kg oil-Eq
freshwater ecotoxicity - FETP <sub>inf</sub>	kg 1,4-DCB-Eq
freshwater eutrophication - FEP	kg P-Eq
human toxicity - HTP <sub>inf</sub>	kg 1,4-DCB-Eq
ionising radiation - IRP_HE	kg U235-Eq
marine ecotoxicity - METP <sub>inf</sub>	kg 1,4-DCB-Eq
marine eutrophication - MEP	kg N-Eq
metal depletion - MDP	kg Fe-Eq
natural land transformation - NLTP	m <sup>2</sup>
ozone depletion - ODP <sub>inf</sub>	kg CFC-11-Eq
particulate matter formation - PMFP	kg PM <sub>10</sub> -Eq
photochemical oxidant formation - POFP	kg NMVOC
terrestrial acidification - TAP100	kg SO <sub>2</sub> -Eq
terrestrial ecotoxicity - TETP <sub>inf</sub>	kg 1,4-DCB-Eq
urban land occupation - ULOP	m <sup>2</sup> a
water depletion - WDP	m <sup>3</sup>

# Environmental impact of EU consumption

through the assesement of 16 different impacts using LCA as reference methodology

Analysis of **consumption trends, patterns and scenarios** for **food, housing, mobility, household goods, appliances.**  
Including consumers' behaviour

**Environmental impacts**

(European Commission 2022)

How we can measure  
**the environmental  
burden?**

# Different methods

Different impact categories are measured in different ways.

- Water use - water footprint
- Eutrophication - effect of chemical use
- Global warming - emissions into the air
- Noise pollution – decibels  
the list goes on..

## LCI - Life Cycle Inventory

For each stage of a product life cycle (e.g. resource extraction, manufacturing, use, etc.) data on **emissions into the environment** (e.g. CO<sub>2</sub>, benzene, organic chemicals) and **resources used** (e.g. metals, crude oil) are collected in an inventory.

Each emission in the environment and resource used are then characterised in term of potential impact in the LCIA, covering a number of impact categories.

## LCIA - Life Cycle Impact Assessment

## Areas of protection

- Human health
- Ecosystem health
- Natural resources

## Interpretation

## Goal and scope

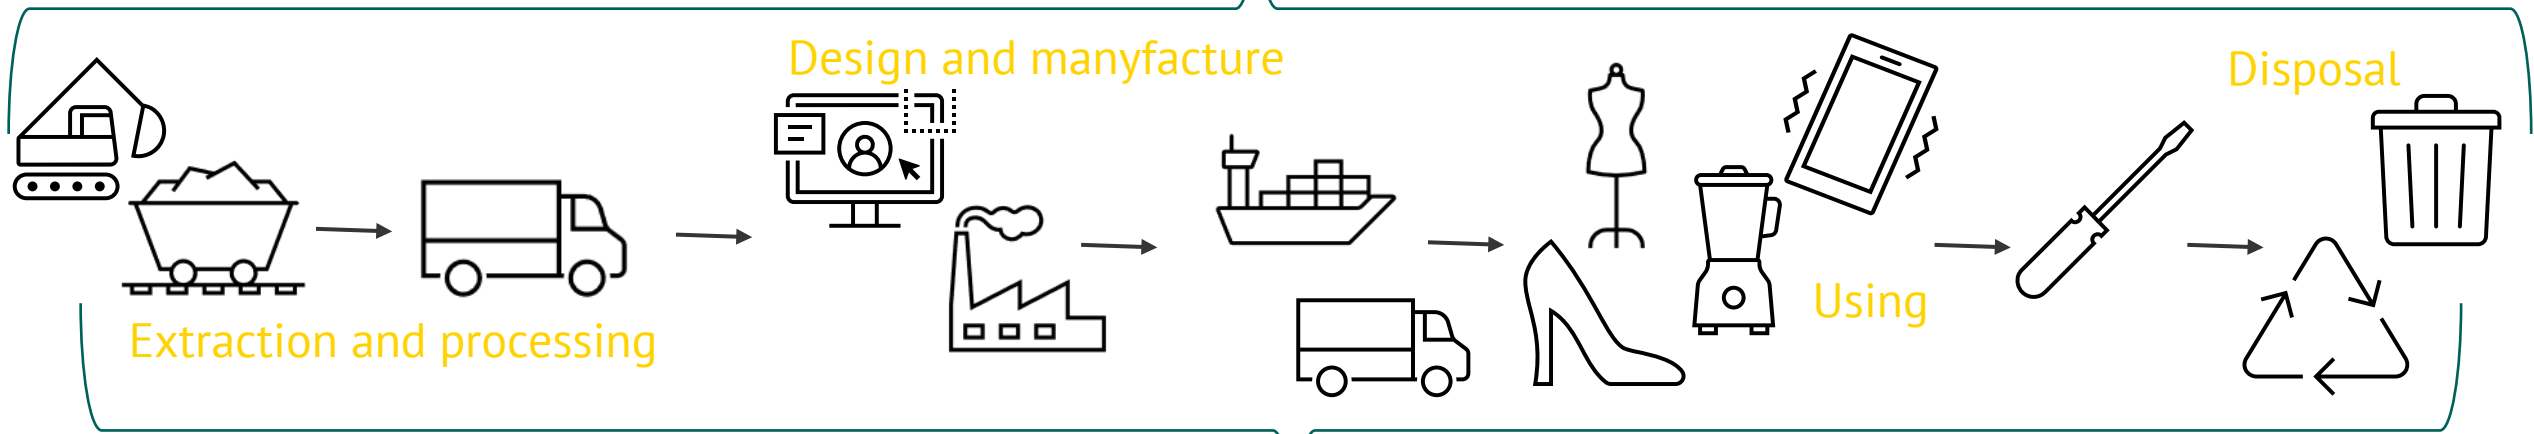

e.g. LCA of a car of typology X, assuming a use for Y years, produced in country Z, ect.

# Life Cycle Assessment

What's the impact

Resources it needs

**TURKU AMK** 

**What is a water footprint and what does it include?**

**Let's test your water footprint**  
**<https://www.watercalculator.org/wfc2>**

# Conclusion

- All activities produce emissions. Consumption of natural resources, energy, water etc is mandatory in human life, but with circular economy the consumption can be more sustainable.
- In order to reduce the environmental impacts, you need to know where the impacts comes from.
- In a circular economy, emissions calculation is a tool that can be used to find sustainable ways of working.
- Emissions calculation can be used to compare different modes of operation, taking into account different emission categories.
- LCA can be used to find the emission sources most relevant to a certain process and minimize them.
